KAC's line of QDC (Quick Disconnect Coupling) suppressors feature an innovative mounting method, providing the user with consistent and minimized POI shift, and effective flash and sound suppression. The attachment method separates the locking parts from mounting surfaces, making carbon build-up a reduced concern. Consistency in POI shift is maintained through identical lock-up of the mounting hardware during attachment. These signature reduction devices are available in two sizes; the standard QDC model for optimal reduction of flash and sound, and the CQB model for needed maneuverability in tight confines.

The KAC 7.62mm MAMS (Multi-Axis Muzzle Stability) muzzle brake provides compensation in all axes, allowing the shooter to maintain point of aim from either shoulder, in any position. The MAMS is designed to minimize shooter signature by reducing flash, blast, and lateral concussive force compared to other similarly performing brakes. The QDC mounting method provides industry-leading suppressor shift mitigation and consistency, and is compatible with the family of 762QDC suppressors.

The KAC QDC Flash Hider is a major step forward in signature reduction and suppressor hosting. The 5 irregular slots effectively disrupt flash and minimize ground disturbance when fired without a suppressor mounted, and provide industry-leading POI consistency with QDC signature reduction devices. Muzzle device kits come complete with shims and thread locker for assembly.
